Title : Building and civil engineering works - Digital management of the informative processes - Part XX - Digital Twin for Infrastructure
Scope : This proposed legislation establishes a framework for the implementation and application of the Digital Twin for infrastructure. The link to smart cities will also be addressed. The Digital Twin represents a dynamic virtual model of a physical entity or system, used to optimize decision-making processes, improve operational efficiency and ensure sustainability. Included in the standard are definitions, content, requirements for technologies and tools, as well as application purposes and use cases in different infrastructure contexts. An integrated framework for the representation, simulation, monitoring, and digital information management of infrastructure assets over time is identified, depending on the organizational context and ongoing processes of the implementing Organizations. The skills and knowledge required and operational responsibilities for fostering the adoption and deployment of Digital Twins in infrastructure contexts are included.

Title : Digital structure documentation - Part 2: Building Information modeling (BIM) - Basics for the application

Scope : This document regulates the technical and organizational principles for the application of the open BIM method (Building Information Modeling) throughout the entire life cycle of all types of buildings and their equipment.
These principles create the prerequisites for

- the open collaboration of all those involved in the life cycle - from the idea to planning and execution and management to demolition and disposal
- the technical implementation of a product-neutral data exchange
- for a common data model and the data storage of information.

This document creates the basis for a comprehensive, uniform, product-neutral, systematic exchange of graphic data and the associated factual data based on IFC (Industrial Foundation Classes) including extensions in accordance with ÖNORM EN ISO 12006-3.

Title : Internal acoustical characteristics of confined spaces - Design methods and evaluation techniques - Part 3: Offices

Scope : This part of the standard provides indications for obtaining acoustically suitable environments for working in spaces such as offices and technical and/or professional studios, including open plan offices with any spaces open to the public. It is already recognised that in such environments, particularly in office areas, discomfort, stress, fatigue and even some pathologies are in part the consequence of insufficient acoustic quality, with effects on the productivity of the occupants, as well as on the quality of the time spent at work. In offices, the key factors for guaranteeing comfort, efficiency and productivity depend significantly on the type of activity, the architectural project and the habits of the occupants, as well as the external context. On one side, speech privacy shall be guaranteed; on the other side, short communication between adjacent workers shall be achieved.

Title : Acoustics - Noise mitigation measures - Part 2: Cost-effectiveness analysis
Scope : This technical specification provides the entities responsible for action plans, as identified by Legislative Decree no. 194 of August 19, 2005, with an operational technical tool detailing the methods for conducting cost-effectiveness and cost-benefit analyses. These analyses complement the financial information required in Annex V of the same decree and further referenced in Legislative Decree no. 42 of February 17, 2017, under Article 26, which outlines the criteria for economic sustainability. This part of the technical specification describes the methods for evaluating the effectiveness and efficiency of noise mitigation measures to identify the most economically advantageous strategy or solution.

Title : Building acoustics - Protection against noise in buildings - Part 5: Requirements for buildings classification rules

Scope : This standard specifies the principles of acoustic classification of buildings or their separate compact parts and requirements for protection against noise in residential, collective residential and public buildings with an increased acoustic standard.

The requirements and principles given in this standard apply to:

- design, construction, reconstruction, superstructure and extension and change of use of buildings,
- acoustic assessment of entire buildings or their separate compact parts,
- acoustic classification of buildings or their separate compact parts.

Acoustic classification according to the principles given in this standard does not cover residential buildings located in areas where, due to the occurrence of aircraft noise, a limited use area has been established.

PN-B-02151-2 and PN-B-02151-3 establish the minimum acoustic requirements for residential buildings with a basic standard, designated in the standard as AQ-0.

Title : Energy performance of industrial buildings - Determination method

Scope : NTA 8801 provides terms, definitions and the method for determining the numerical value of the energy performance and derived indicators of an industrial hall. In general, this is a numerical value in kWh/m² per year, with the exception of the share of renewable energy, which is shown as a percentage. The scope extends to all buildings with a commercial hall function, for which (building) regulations set requirements for energy performance, both new and existing.

Title : Calculation of climate adjustment factors for use in NS 3031:2025
Scope : The method involves calculating the energy use or energy performance of a building for the local climate in which the building is located or is to be constructed. This energy performance can then be calculated into a standardized energy performance by dividing by a climate adjustment factor. The standardized energy performance can then be used, for example, to set requirements for energy performance in building regulations and for energy label levels in the energy labelling scheme regardless of local climate. The climate adjustment factors can be calculated from model buildings with given technical and building physics design that are simulated for the various local climates.

Title : Guidelines for gas installations - Section flue system - Part 46: Supply of combustion air and discharge of combustion products for single used condensing gas appliances type C - Choice of constructions and materials - Guidelines for NEN 2757-1
Scope : This part of the NPR applies to a single (non-common) metal or plastic exhaust system for a gas-fired condensing type C appliance (closed) with built-in fan, up to a load of 130 kW at maximum value, in homes or (residential) buildings. Connection cables of appliances placed in collective systems also apply.

Title : Waterworks - Part 2: Water purification

Scope : This Estonian standard applies for public or private water supply systems for design and construction of water treatment plants.
Standard does not apply to special-purpose and industrial water treatment.
Water treatment includes water intake, water purification, preservation and distribution to customer (see figure 1). Water intake-water source selection should be in accordance with standard EVS 847-1, distribution to consumer with standard EVS 921.
Standard annexes A and B includes recommended guidance material.

Title : Electrical regulations. Internal electrical wiring
Scope : The current standard STN 33 2130:1983 was published more than 40 years ago. The
 requirements in the standard are outdated and obsolete. Since the standard was issued,
 technological developments in the field of electrical installations have advanced
 considerably, the extent to which buildings and other objects are equipped with electrical
 equipment has changed considerably, the characteristics of electrical equipment have
 changed significantly, the social situation has changed and the resulting legal environment
 has changed, which regulates the rules in the field of electrical and fire safety, energy
 efficiency and also supplier-customer relations. Standard STN 33 2130 requires a

comprehensive revision and a proper interconnection with other standards in the system of Slovak technical standards.

Title : Calculation of climate adjustment factors for use in NS 3031:2025
Scope : The method involves calculating the energy use or energy performance of a building for the local climate in which the building is located or is to be constructed. This energy performance can then be calculated into a standardized energy performance by dividing by a climate adjustment factor. The standardized energy performance can then be used, for example, to set requirements for energy performance in building regulations and for energy label levels in the energy labelling scheme regardless of local climate. The climate adjustment factors can be calculated from model buildings with given technical and building physics design that are simulated for the various local climates.
