Title :	Steel products for reinforced concrete – Reinforcements – Part 2: Assembled reinforcements with non load-bearing joints		
Scope :	The standard specifies the requirements for the assembled reinforcements in Transformation Plants, Prefabrication Plants, and on Construction Sites for use as structural reinforcement in reinforced concrete. Assembly joints are not intended for load-bearing, not even during lifting operations; they are solely intended for maintaining the shape of the reinforcements during handling and concrete casting. This document is not applicable to: - the manufacture of welded wire mesh and lattice girders; - the assembly of reinforcement elements with load-bearing joints; - steel for prestressed concrete; - the manufacture of reinforcement elements. Note 1: For the preparation of reinforcement elements, reference is made to UNI 11967-1. Note 2: According to the current Italian Building Code (at the date of publication of this part of the standard, Ministerial Decree 17.01.2018 - §11.3.2.4), cutting and bending and/or assembly can be carried out: on site, under the supervision of the Works Management; in Processing Plants, only if they meet the requirements of § 11.3.1.7; and in Prefabrication Plants according to the provisions of §11.8.3.1. Note 3: Assembly may involve welded wire mesh and lattice girders.

ICS :			
National Ref :	PNE 88111		
Title :	Fibre cement profiled sheets and fibre cement profiled sheets with PUR incorporated. Guidelines for the use on roofing.		
Scope :	The purpose of this standard is to define the basic characteristics of the materials to be used and to establish the criteria to be taken into account for the design of roofs in which corrugated or ribbed fibre-reinforced concrete slabs are used, including slabs with built-in insulation in accordance with Standards UNE-EN 494 and UNE 88113. It also establishes the recommendations for the transport, handling and storage of the materials. Finally, it indicates the conditions of use and maintenance of the roofs in order to ensure their durability. This standard is applicable to work carried out on roofs of all types of buildings in which corrugated or ribbed fibre-reinforced concrete slabs are used, and in which the slabs themselves provide the watertightness. For altitudes above 1200 m, and in special or exceptional cases, it is up to the designer or the project manager to establish additional instructions to this standard (e.g. use of special fixings, protection against powdery snow, etc.).

ICS :			
National Ref :	PNE 85160		
Title :	Security doors and hardware. Minimum requirements related to protection and resistance class. Selection, application and installation criteria.		
Scope :	This standard specifies the requirements of the locking system for burglar-resistant security doors from resistance class 3, indicated in the UNE-EN 1627 standard. The standard applies to the whole of the door, including its frame, its hardware (pivoting elements, and closing and locking system), and includes recommendations for its installation		

and maintenance.

The standard establishes a classification of the security doors according to additional parameters to the resistance to burglary: the protection against attacks of skill without force on things or with the use of instruments that allow the door to be opened without leaving evidence of the attack, visible to the naked eye, i.e. non-violent attacks and the corresponding documentary control.

The standard also defines additional test methods in which the use of new tools is considered for the manual attack and documentary verification, which improve the protection of the locking device against non-violent attacks. These additional parameters define different levels of protection.

The standard contains recommendations on possible adaptations or pre-installations to incorporate sensors or detectors, which can be connected to electronic burglar and intruder alarm systems, access control, locking and opening, and their proper installation, as well as the maintenance of security doors.

National Ref : NTA 8230-1:2025 Concept nl
Title : Biobased construction - Terms, definitions and determination of biobased content of construction products and buildings
Scope : This NTA provides an overview of the standards, terminology and standard determination methods (including biobased content) that apply throughout the biobased construction sector and beyond ('horizontal standards'). This also serves as a useful reference document for the NMD. The NTA will contain many references to the content of existing standards and norms, including those of NEN, CEN/TC 411 "Bio-based products", CROW, KOMO and various other standard and/or scheme managers. Where relevant, this NTA contains additional specifications, including terms that are not yet covered in other standards, such as bio-enriched and natural fibre reinforced plastic composite (biocomposite). In addition to terms and definitions, measurement methods and other relevant topics for biobased construction are also elaborated on a sector-wide level.

National Ref : NTA 8230-2:2025 Concept nl
Title : Biobased construction - Part 2: Fire safety aspects of biobased building products, building components and structures
Scope : There is a need for requirements and test methods for fire safety of facades. Not at material level but at end-use level, so in applied form, including ventilation holes, seams, cavity, etc. This results in a test level that is better suited to the application. The test methods are available in existing standards, but are not included in requirements for biobased facade constructions. Better specifications of what must be tested when applying biobased products are necessary for safe application. Current test methods at product level are not sufficient. In order to make these risks transparent - and thus avertible - broadly supported requirements for testing biobased facade constructions are important.
